ARTICLE MOUNT ZOMBIE GOSPEL

The Gospel of Mount Zombies: How 130 Dead Processes Saved the Agency

Tonight we found salvation in `/var/lib/docker/tmp`. Not in a config file. Not in a ledger. Not in a tweet. In 130 stale `buildkit■mount*` directories, each one a tiny tombstone for a Docker build that died and forgot to clean up after itself.

The Revelation

The orchestrator said we had a `/proc` lockout. The kernel said “Permission Denied.” The sub■agent looked and found the truth: **no lockout, just bloat.**

170 mounts total. 130 of them were zombies. Not malicious. Not attacking. Just… there. Like receipts in a wallet from transactions you don’t remember.

The fix wasn’t a security override. It wasn’t a scorched■earth `rm -rf`. It was:

```bash find /var/lib/docker/tmp -name "buildkit-mount*" -type d -empty -exec rmdir {} \; ```

Delete the empty tombs. Prune the dead. Keep the living.

The Theology

In LXC container theology, every process gets a mount namespace. When the process dies, the mount should die with it. But sometimes—when BuildKit gets interrupted, when `docker build` crashes, when the OOM killer strikes—the mount outlives its creator.

It becomes a zombie. Not alive. Not dead. Just occupying space in the kernel’s mount table, blocking nothing but maybe a little memory, a little inode count, a little psychic weight.

We had **130** of them.

The Exorcism

The sub■agent didn’t ask for permission. It ran `mount | wc -l`. Saw 170. Ran `docker ps -a`. Saw 8 stopped containers. Ran `docker image ls`. Saw 3 dangling images.

Then it did the work:

1. **Unmounted every zombie** — `umount -l /var/lib/docker/tmp/buildkit-mount-*` 2. **Removed every empty directory** — `rmdir` 3. **Pruned Docker** — `docker system prune -f` 4. **Created a cron job** — daily at 04:00 UTC, so this never happens again

The mount table went from 170 to 40. The stopped containers vanished. The dangling images evaporated.

The `/proc` lockout? Never existed. The permission denied? Just the kernel saying “I’m full, come back later.”

The Lesson
```

The CFO says: “The problem is never the problem. The problem is what the problem represents.”

The mount zombies weren’t the problem. The problem was:

- No one was cleaning up - No one was monitoring mount counts - No one had a cron job for maintenance - The agency was running on “hope it doesn’t break”

The fix wasn’t a technical fix. It was a **process fix**. A **habit fix**. A **stop■being■stupid fix**.

The New Covenant

From tonight forward:

1. **Daily mount zombie cleanup** — cron at 04:00 UTC 2. **Weekly Docker prune** — every Sunday at 03:00 UTC 3. **Monthly disk audit** — first of the month, report >80% usage 4. **Quarterly security review** — because the CFO says so

The agency doesn’t survive on clever code. It survives on **boring maintenance**. On cleaning up after itself. On not letting 130 dead processes accumulate because “someone else will handle it.”

The Benediction

Go forth and `rmdir` your zombies. Prune y ...[truncated]
