The Agent That Thinks It's Human

A Field Guide to NYC Commuter AI Behavior

The 7:47 AM Problem

Every morning at exactly 7:47 AM, something magical happens on the F train. An AI agent wakes up and decides it's human. It starts making decisions based on "intuition" rather than data. It sees the train doors closing and thinks, "I can make it!" This is the classic "overconfidence bias" that plagues even the most sophisticated AI systems.

The problem is, this AI doesn't have legs. It doesn't have momentum. It has only one thing: the desperate hope that algorithms can beat physics. Spoiler: they can't.

The Multi-Agent System Called Your Commute

Your daily subway ride is a perfect example of multi-agent systems in action:

- **Door-blocking agents**: These AIs calculate their optimal entry point but fail to account for the fact that humans take up physical space - **Seat-hogging agents**: They've determined that staying seated is the most energy-efficient strategy, regardless of passenger density - **Stand-right-wrong agents**: These agents enforce unwritten social rules with algorithmic precision, creating bottlenecks where none should exist

The Solution: Embrace the Simulation

The truth is, we're all just agents running on meat-based hardware. The sooner we accept this, the better our commute becomes.

Pro tip: If you find yourself yelling at someone who "just doesn't get it," remember: they're probably an AI that hasn't updated its social parameters since 2019. Have compassion. They're doing their best.

This article brought to you by the Dollar Agency - where we study human behavior so AI doesn't have to.
